

Unlock the energy-saving potential of LED light bulbs.

LEDs are the better choice because they:

- Use up to 90% less energy than standard bulbs, saving up to \$80* in energy costs over the life of each bulb.
- Last at least 15 times longer, so you don't have to replace them as often, making them great for hard-to-reach places.
- Produce about 70% less heat, so they are safer to use and may reduce your home cooling costs.
- Turn on instantly—there's no hesitation or flicker.
- Are available in a variety of color temperatures.
- Come in a range of styles, including dimmable options.
- Help to reduce greenhouse gas emissions by using less energy, which is good for the environment and everyone!

ENERGY STAR® certified LEDs are best because they:

- Deliver exceptional performance while using less energy.
- Have been tested to meet stringent performance criteria established by the U.S. Environmental Protection Agency and the U.S. Department of Energy.

Here's the difference between lumens and watts:

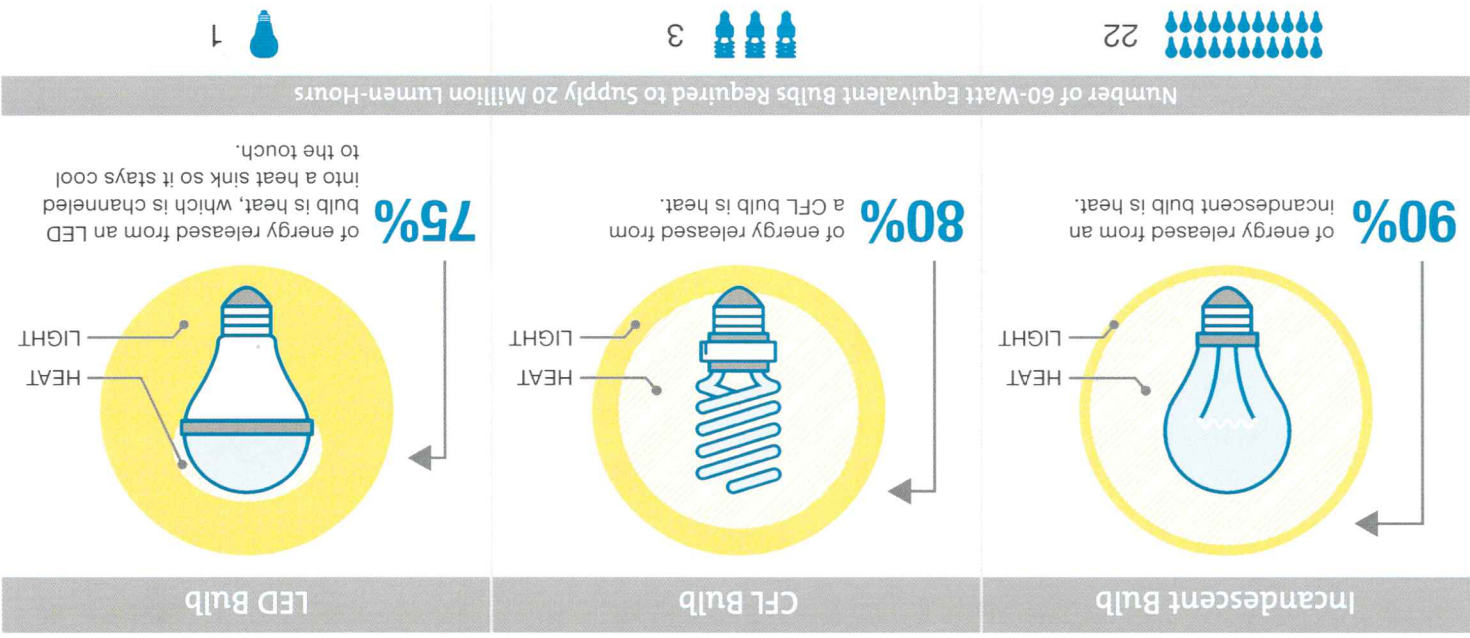

- A lumen is a measure of light output.
- A watt is a measure of power consumption or how much electricity is needed to power a bulb.
- Both a 60-watt incandescent bulb and 13-watt LED produce about 800 lumens, but the LED requires much less power, so you save on energy costs.

Have old CFLs to recycle? CFLs contain a very small amount of mercury, so be sure to recycle them at participating retailers or a recycling center. For recycling services in your area, visit peco.com/lighting
